

# Green FDI and Technological Spillovers in the Host Economies

Roberta Rabellotti  
Università di Pavia

with Vito Amendolagine & Dalila Ribaudo

# Motivation

---

- Multinational enterprises (**MNEs**) with green innovative capability can contribute to **diffuse environmentally friendly knowledge**.
  - Amendolagine, Lema, Rabellotti (JoCP, 2021) show that green **FDIs increase the green specialization of MNEs**.
  - Amendolagine, Hansen, Lema, Rabellotti & Ribaudo (WD, 2023) show that foreign **subsidiaries of green MNEs are more innovative** than domestic firms with similar characteristics.
- In this paper we investigate **green FDI forward technological spillovers**, proxied by citations of MNEs green patents by patents in the host countries.

# Two examples

---

is a global leader in wind technologies based in Aarhus (Denmark):

- Its patents are cited by foreign inventors located in 43 countries;
- From 1997 to 2020 it has done 37 green FDI in 21 different countries;
- On average, **Vestas' green patents received 1054 citations in host countries**, and 176 citations in other countries.

is a global leader in wind technologies, based in Pune (India)

- Its patents are cited in 22 different countries;
- From 1997 to 2020 it has done 10 green FDI in 8 different countries;
- On average, **Suzlon's green patents received 135 citations in host countries**, and 81 citations in other countries.

# The literature

---

- **Green FDI can enhance innovation in RE technologies** in investors and in their foreign subsidiaries (Amendolagine et al., 2021, 2023)
  - Results are conditioned by **development/innovation level of the host economies**, FDI type (greenfield/acquisitions); RE technology (solar/energy).
- **FDIs can generate spillovers** in destination economies, boosting productivity (Javorcik, 2004; Gong, 2023) and innovation (**Branstetter**, 2006; Grafstrom, 2018; Tan et al., 2022) in local economies
- **The impact of green technologies on subsequent inventions is larger** and more pervasive with respect to non-green technologies (Dechezleprêtre et al., 2014; Barbieri et al, 2020)

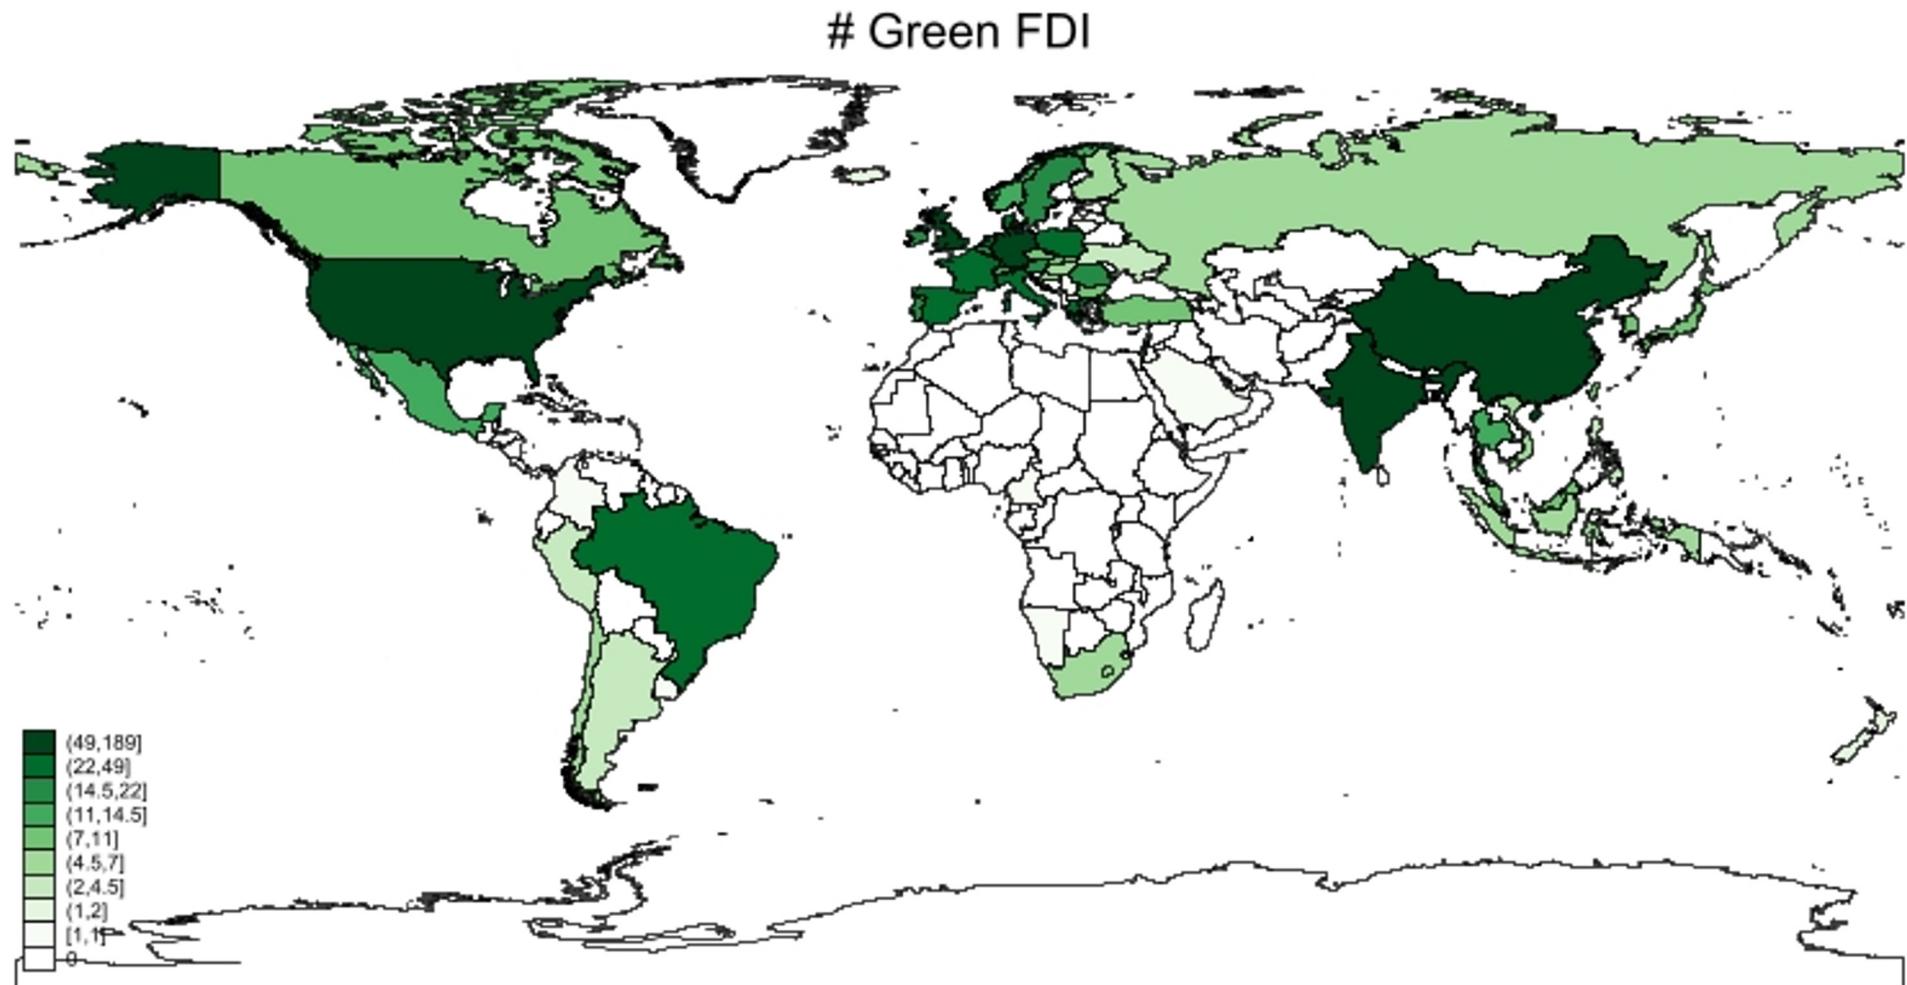

# Methodology: how green FDI are identified

---

As in Amendolagine et al. (2021) and Amendolagine et al. (2023)

1. Identify all patents in “*technologies or applications for mitigation or adaptation against climate change*” (EPO classification: **Y02E category**);
2. Focus on **technologies related to energy generation** from renewable and non-fossil sources, i.e. **wind, solar, hydro, geothermal, marine, waste, biofuel** (DOCDB families);
3. Select among them, all the green patents **with a firm as applicant**;
4. Identify among the **firms with at least one green patent**, those with at least one foreign subsidiary (>50% ownership);
5. Textual search on the foreign subsidiaries’ business activity to select only FDIs aimed at establishing or acquiring subsidiaries related to the **production or distribution of renewable energies**.

# Green FDI in 66 countries (1997-2020)

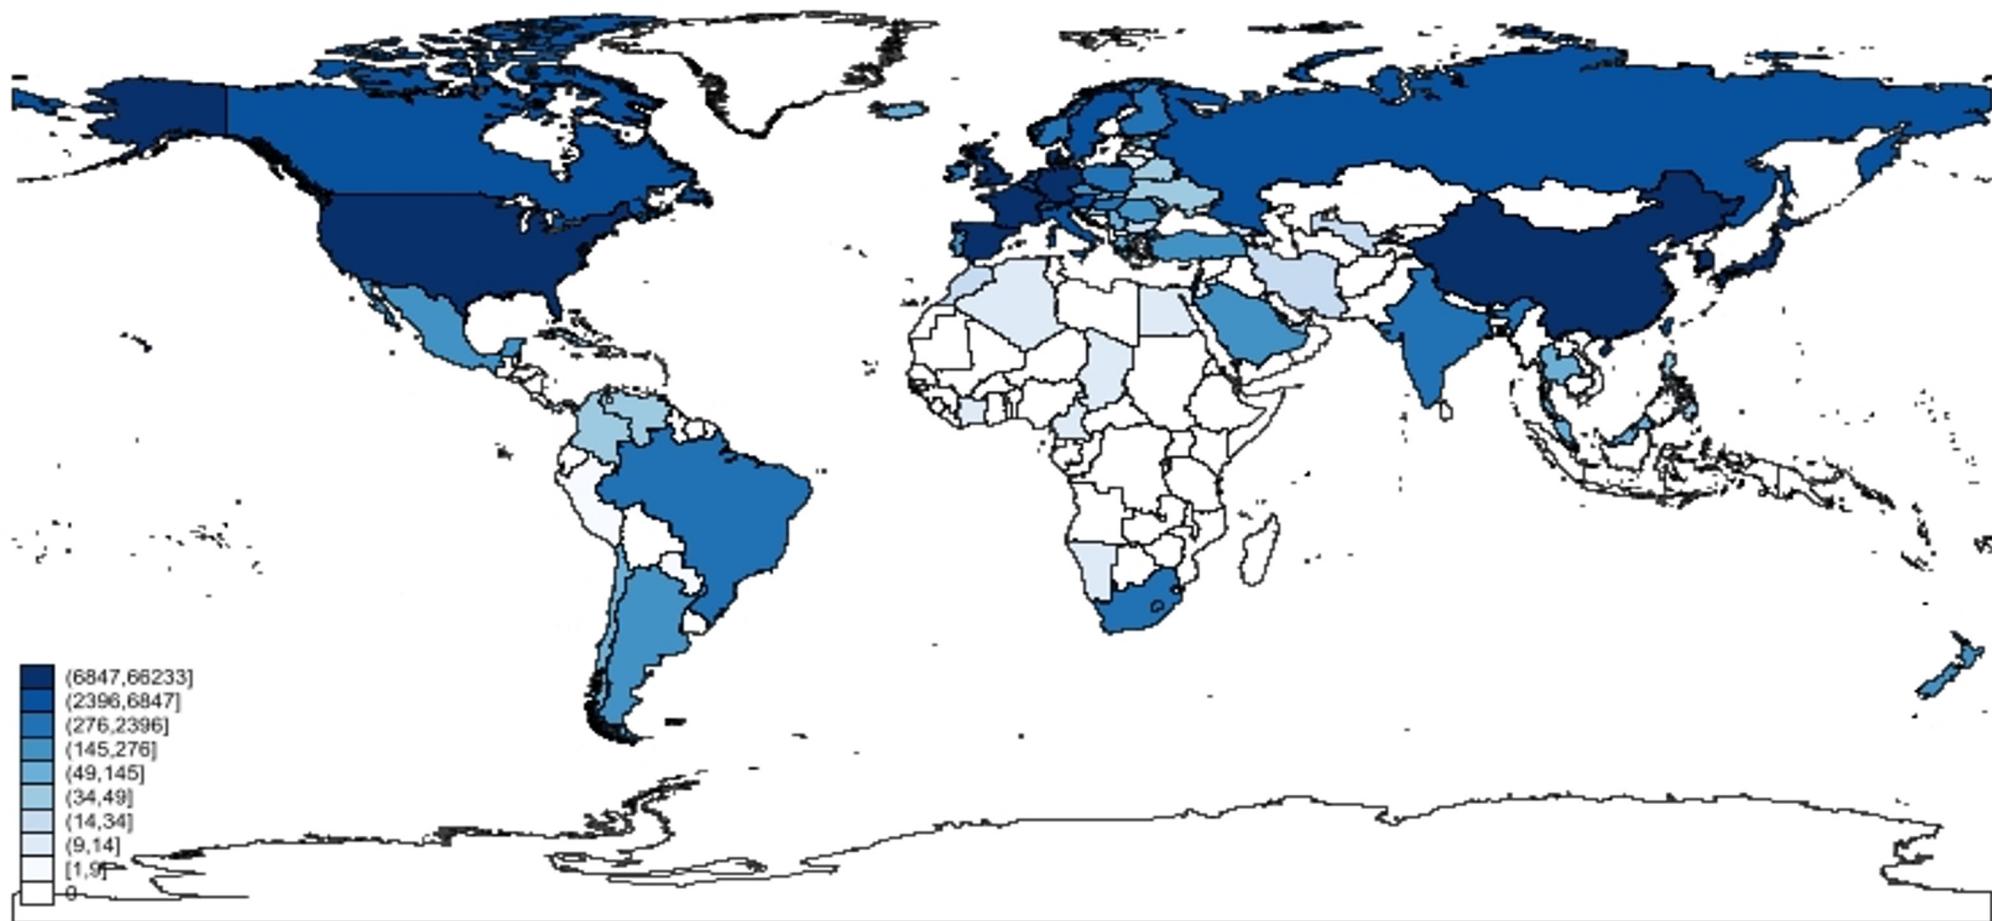

# Dataset

---

- Based on PATSTAT: (non-self) **forward citations to green patents owned** by green investors and their subsidiaries;
- For each investor  $i$ , we consider all the countries  $j$  where **foreign citations to their green patents are based**, according to the address of the first inventor.
- For each country  $j$ , we consider:
  - the number of forward citations to green patents of the investor  $i$  by the first inventor based in country  $j$ ;
  - the number of FDI of the investor  $i$  in country  $j$ ;
- Time span of green FDI:1997-2020
- Two sub-samples for **solar** and **wind** technologies.

# MNEs green patents citations in 94 countries

# Foreign forward citations to MNEs' green patents

# Dataset: an example

---

*Investor  $\alpha$*  undertook two investments in 1998 in country A (host country) and its green patents are cited in countries A and B (where there are not investments from  $\alpha$ ).

Investor (i)	Country (j)	Year (t)	#Forward Citations	FDI
$\alpha$	A	1997	#	0
$\alpha$	A	1998	#	2
$\alpha$	A	....		...
$\alpha$	A	2020	#	0
$\alpha$	B	1997	#	0
$\alpha$	B	1998	#	0
$\alpha$	B	....		..
$\alpha$	B	2020	#	0

# Forward Spillover

$$\begin{aligned} \textbf{\textit{Forward Citations}}_{i,j,t} = & \alpha + \beta_1 \textit{Cumulative Green Patents}_{i,t} + \\ & + \beta_2 \textit{Green Patents Age}_{i,t} + \beta_3 \textit{FDI}_{i,j,t-s} + \gamma_i + \delta_j + \theta_t + \epsilon_{i,t,j} \end{aligned}$$

# of forward citations to all green patents by the investor  $i$  based in country  $j$ , cumulated up to year  $t$

- All estimations include investor, host country and year fixed effects, errors are clustered at the investor level

# Independent Variables

---

- **# of green FDI** by investor  $i$  in country  $j$  at year  $t$
- **Dummy variable** taking value 1 for country  $j$  where the investor has at least one investment at the year of the first investment, and 0 otherwise
- **Cumulative Green Patents<sub>i,j,t</sub>** : cumulative # of green patents owned by investors  $i$  up to year  $t$
- **Green Patents Age<sub>i,j,t</sub>** : share of the cumulative # of green patents owned by investor  $i$  up to year  $t$  in a citable age (i.e. 4-6 years)
- **Green Patents<sub>i,t</sub>** # of green patents by investor  $i$  at time  $t$
- $\gamma_i, \delta_j, \theta_t$  fixed effect for investor  $i$ , country  $j$ , year  $t$ .
- s=0,1,2,3

# Macro-level mediating factors

---

- **GDP per capita** (World Bank)
- **OECD Environmental Policy Stringency Index (EPS)**: degree to which environmental policies fix an explicit or implicit price on polluting or environmentally harmful behavior. It ranges from 0 (not stringent) to 6 (highest degree of stringency)

# Preliminary results

# Preliminary conclusions

---

- **Green FDIs** are important drivers of innovation in green technologies;
- Their **impact is not limited to the MNEs' boundaries** (Amendolagine et al., 2021) and at level of subsidiaries (Amendolagine et al., 2023)
- **Green FDIs increase forward technological spillovers in the host countries, enhancing green innovative activities;**
- Their impact is stronger in case of **cross-border acquisitions** rather than in greenfield investments and in the **wind industry** with respect to the solar sector.
- Their impact is more evident in **developing economies** and in countries with **stricter environmental policy**.
